Experience a Whole New Level of Engine Quality and Reliability

Extensive research and development is performed prior to the release of any JASPER® Engine to ensure all processes, parts and specifications will provide you with quality, value and reliable performance. JASPER also offers engine specific updates to make certain our engines meet, or exceed, the original manufacturer's measured standards.

Every JASPER Engine is completely disassembled, thoroughly cleaned, and inspected. Wear parts – pistons and bearings, among others, are replaced with new parts. All castings are remanufactured to exact dimensional tolerances.

Before

After

The latest Computer Numerical Control (CNC) machinery provides the versatility of resurfacing an engine block and boring its cylinders where applicable. Improved probing and tooling features provide optimal machining accuracy and surface finish.

JASPER Associates receive extensive ongoing training through various programs, including ASE, ASQ and AERA. We never stop learning, training and innovating, which allows us to consistently improve our production processes and product quality.

Most popular complete gas engines are live-run tested with data acquisition. Compression, vacuum and oil pressure are monitored and recorded. Testing is concluded with a black light leak inspection to ensure engines are free of oil leaks.

Don't forget to ask for an engine installation kit!
